Structure and Function of Muscles

Understanding muscle anatomy is vital for grasping how movement and physical activity work.

Muscle Anatomy Basics

Muscles are composed of bundles of muscle fibers, which are made up of smaller units called myofibrils. These fibers contain the proteins actin and myosin, essential for muscle contraction.

Types of Muscles

The three muscle types differ in structure, control, and function:

- **Skeletal Muscles:** Voluntary muscles attached to bones, responsible for conscious movement.
- **Smooth Muscles:** Involuntary muscles found in walls of internal organs like the stomach and blood vessels.
- **Cardiac Muscles:** Involuntary muscles of the heart, specialized for continuous rhythmic contractions.

Muscle Contraction and Movement

A core part of the Unit F curriculum involves understanding how muscles contract and produce

movement.

The Sliding Filament Theory

This theory explains muscle contraction at a microscopic level:

- When a muscle receives a signal, calcium ions are released.
- Myosin heads attach to actin filaments forming cross-bridges.
- Myosin pulls the actin filaments, shortening the muscle fiber.
- ATP provides the energy for this process.

Types of Muscle Contractions

Students learn about:

- Isotonic Contractions: Muscle length changes (e.g., lifting weights)
- Isometric Contractions: Muscle length remains the same (e.g., holding a plank)
- Concentric and Eccentric Movements: Muscle shortening and lengthening during contraction

Major Muscle Groups and Their Functions

Students are introduced to key muscle groups, their locations, and roles in movement.

Upper Body Muscles

- Pectorals: Chest muscles responsible for pushing movements
- Deltoids: Shoulder muscles aiding in lifting and rotating the arm
- Biceps Brachii: Front of the upper arm, flexes the elbow
- Triceps Brachii: Back of the upper arm, extends the elbow

Lower Body Muscles

- Quadriceps: Front thigh muscles for knee extension
- Hamstrings: Back thigh muscles aiding in knee flexion
- Gluteal Muscles: Buttocks involved in hip movement
- Calf Muscles (Gastrocnemius and Soleus): Responsible for foot movement and walking

Core Muscles

- Abdominals: Support trunk movement and posture
- Erector Spinae: Back muscles maintaining spinal stability

Muscles Working in Pairs

Movement is facilitated by muscles working antagonistically in pairs.

Example of Muscle Pairs

- Biceps and Triceps: Biceps flex the arm, triceps extend it
- Quadriceps and Hamstrings: Quadriceps extend the knee, hamstrings flex it
- Abdominals and Erector Spinae: Work together to stabilize and move the spine

Understanding these pairs helps students grasp how coordinated muscle activity produces smooth, controlled movements.

Common Muscular Disorders and Injuries

Part of the curriculum involves recognizing health issues related to muscles.

Common Disorders

- Muscle Strains: Overstretching or tearing of muscle fibers
- Muscle Cramps: Sudden, involuntary contractions often caused by dehydration or fatigue
- Tendinitis: Inflammation of tendons connecting muscles to bones
- Muscular Dystrophy: Genetic disorder causing progressive muscle weakness

Preventive Measures and Treatments

Students learn about:

- Proper warm-up and stretching routines
- Maintaining hydration and nutrition
- Rest and recovery strategies
- Medical interventions when necessary
