

ELECTROCHEMICAL CELLS SECTION REVIEW ANSWER KEY Complete Guide

electrochemical cells section review answer key

Understanding electrochemical cells is fundamental in the study of chemistry, especially when exploring redox reactions, electrical energy production, and various practical applications such as batteries and electrolysis. This review provides a comprehensive overview of the key concepts, principles, and problem-solving strategies related to electrochemical cells, designed to reinforce your knowledge and prepare you for exams. By examining typical questions and their detailed answers, students can better grasp the structure and function of electrochemical cells, their components, and how to analyze their behavior.

Introduction to Electrochemical Cells

What is an Electrochemical Cell?

An electrochemical cell is a device that converts chemical energy into electrical energy or vice versa. It involves a spontaneous redox reaction that produces an electric current, which can be harnessed for practical applications. These cells are fundamental in batteries, fuel cells, and electrolysis processes.

Types of Electrochemical Cells

Electrochemical cells are primarily classified into:

- **Galvanic (Voltaic) Cells:** Generate electricity from spontaneous chemical reactions.
- **Electrolytic Cells:** Use electrical energy to drive non-spontaneous reactions.

Components of Electrochemical Cells

Key Parts of a Galvanic Cell

A typical galvanic cell consists of:

- **Anode:** Electrode where oxidation occurs, negatively charged in a galvanic cell.

- **Cathode:** Electrode where reduction occurs, positively charged in a galvanic cell.
- **Electrolyte:** Substance that contains ions and allows the flow of charge.
- **Salt Bridge:** Maintains electrical neutrality by completing the circuit.

Understanding the Electrodes and Electrolytes

Electrodes are often made of inert materials like platinum or graphite when reactions involve ions in solution. The electrolyte's composition determines the ion flow and influences the cell's voltage and efficiency.

Standard Cell Notation and Cell Representation

Standard Cell Notation

Cell reactions are represented by a standardized notation:

Anode | Anode Solution || Cathode Solution | Cathode

For example:

$\text{Zn} \mid \text{Zn}^{2+} (1 \text{ M}) \parallel \text{Cu}^{2+} (1 \text{ M}) \mid \text{Cu}$

This notation indicates zinc metal at the anode and copper ions at the cathode, with solutions of 1 molar concentration.

Constructing Cell Diagrams

When analyzing a cell, write the anode on the left and the cathode on the right, separated by double vertical lines representing the salt bridge or membrane.

Electrode Potentials and Cell Voltage

Standard Electrode Potentials (E°)

Each half-reaction has an associated standard electrode potential, measured under standard conditions. These values are tabulated:

- Positive E° indicates a strong tendency to gain electrons (reduction).
- Negative E° indicates a tendency to lose electrons (oxidation).

Calculating Cell Potential (E°_{cell})

The cell potential is determined by:

- Identifying the reduction potentials of both electrodes.
- Using the formula: $E^\circ_{\text{cell}} = E^\circ_{\text{cathode}} - E^\circ_{\text{anode}}$
- For spontaneous reactions, E°_{cell} should be positive.

Example Calculation

Given:

- Zn^{2+}/Zn half-cell: $E^\circ = -0.76 \text{ V}$
- Cu^{2+}/Cu half-cell: $E^\circ = +0.34 \text{ V}$

Calculate:

$$E^\circ_{\text{cell}} = +0.34 - (-0.76) = +1.10 \text{ V}$$

Since the value is positive, the reaction is spontaneous.

Gibbs Free Energy and Cell Potential

Relationship between ΔG and E°_{cell}

The spontaneity of a reaction can be predicted using Gibbs free energy:

$$\Delta G^\circ = -nFE^\circ_{\text{cell}}$$

where:

- ΔG° is the standard Gibbs free energy change,
- n is the number of electrons transferred,
- F is the Faraday constant (96,485 C/mol),
- E°_{cell} is the cell potential.

A negative ΔG° indicates a spontaneous process.

Calculating ΔG°

For the previous example:

- $n = 2$ electrons (for Zn^{2+}/Zn and Cu^{2+}/Cu)
- $E^\circ_{\text{cell}} = 1.10 \text{ V}$

Calculate:

$$\Delta G^\circ = -2 \times 96,485 \times 1.10 = -212,267 \text{ J/mol}$$

The negative value confirms spontaneity.

Standard Hydrogen Electrode and Electrode Potentials

Standard Hydrogen Electrode (SHE)

The SHE serves as the reference electrode with an assigned potential of 0.00 V. Other electrode potentials are measured relative to SHE.

Using Electrode Potentials to Predict Reactions

- A more positive E° indicates a greater tendency to be reduced.
- The more negative E° , the more likely the electrode is to be oxidized.

Cell Potential and Non-Standard Conditions

Calculating E_{cell} Under Non-Standard Conditions

The Nernst Equation adjusts for concentration effects:

$$E = E^\circ - \left(\frac{RT}{nF}\right) \times \ln Q$$

where:

- R is the gas constant,
- T is temperature in Kelvin,
- Q is the reaction quotient.

At 25°C:

$$E = E^\circ - (0.0592/n) \times \log Q$$

Practical Applications of the Nernst Equation

- Determining cell voltage at different concentrations.
- Predicting the direction of reactions.
- Designing electrochemical cells with specific voltage requirements.

Calculating Cell Potential and Spontaneity

Step-by-Step Approach

To analyze an electrochemical cell:

- Write the balanced half-reactions.
- Identify standard potentials from tables.
- Calculate E°_{cell} .
- Use the Nernst equation if concentrations are non-standard.
- Determine ΔG° for thermodynamic insights.
- Assess spontaneity: positive E°_{cell} and negative ΔG° indicate a spontaneous reaction.

Common Problems and How to Solve Them

Example Problem 1: Determining Cell Voltage

Question:

Given the half-reactions:

- $\text{Zn}^{2+} + 2e^- \rightarrow \text{Zn}$ ($E^\circ = -0.76 \text{ V}$)
- $\text{Ag}^+ + e^- \rightarrow \text{Ag}$ ($E^\circ = +0.80 \text{ V}$)

Calculate the standard cell potential.

Answer:

- Oxidation: $\text{Zn} \rightarrow \text{Zn}^{2+} + 2\text{e}^-$ ($E^\circ = +0.76 \text{ V}$)
- Reduction: $\text{Ag}^+ + \text{e}^- \rightarrow \text{Ag}$ ($E^\circ = +0.80 \text{ V}$)

Since the oxidation potential is the negative of the reduction potential, the overall cell potential:

$$E^\circ_{\text{cell}} = E^\circ_{\text{cathode}} - E^\circ_{\text{anode}}$$

$$= +0.80 - (+0.76) = +0.04 \text{ V}$$

The reaction is spontaneous as E°_{cell} is positive.

Example Problem 2: Effect of Concentration on Cell Voltage

Question:

Calculate the cell potential if the concentration of Ag^+ is 0.01 M and Zn^{2+} is 1 M at 25°C.

Solution:

- Use the Nernst Equation:

$$E = E^\circ - (0.0592/n) \times \log([\text{Zn}^{2+}]/[\text{Ag}^+])$$

- Plug in values:

$$E = 1.56 - 0.0592 \times \log(1/0.01) = 1.56 - 0.0592 \times 2 = 1.56 - 0.1184 = 1.4416 \text{ V}$$

The reduced concentration of Ag^+ slightly lowers the cell potential.

 - Reduction: Gain of electrons.
 - Oxidation Number: A guide to track electron transfer.
- Cell Components
 - Anode: Electrode where oxidation occurs (negative in galvanic cells).
 - Cathode: Electrode where reduction occurs (positive in galvanic cells).
 - Salt Bridge: Maintains electrical neutrality by allowing ion flow.
 - Electrolyte: Conducts ions between electrodes.
- Cell Potential (E°)
 - Represents the driving force behind electron flow.
 - Calculated using standard reduction potentials.

- Positive E° indicates spontaneous reactions.

- Standard Conditions

- 1 M concentrations.

- 25°C temperature.

- 1 atm pressure.

Types of Electrochemical Cells and Their Review Focus

Galvanic Cells

- Generate electrical energy from spontaneous redox reactions.

- Examples: Daniell cell, lithium-ion batteries.

Electrolytic Cells

- Use electrical energy to drive non-spontaneous reactions.

- Examples: Electroplating, electrolysis of water.

Common Review Questions and Their Answer Key Breakdown

- What is the significance of the standard reduction potential table?

Answer Explanation:

The standard reduction potential table lists the potential difference associated with various half-reactions under standard conditions. It helps determine the spontaneity of reactions and calculate the overall cell potential (E°_{cell}). In review, understanding how to interpret and utilize this table is crucial for solving problems related to cell voltage and predicting reaction feasibility.

Key Points:

- The more positive the reduction potential, the greater the tendency to gain electrons.

- To find E°_{cell} , subtract $E^\circ(\text{anode})$ from $E^\circ(\text{cathode})$:

$$E^{\circ}_{\text{cell}} = E^{\circ}(\text{cathode}) - E^{\circ}(\text{anode})$$

- How do you determine the anode and cathode in an electrochemical cell?

Answer Explanation:

In a galvanic cell, the anode is where oxidation occurs (loss of electrons), and the cathode is where reduction takes place (gain of electrons). The electrode with the more negative reduction potential acts as the anode, while the one with the more positive potential acts as the cathode.

Review Tip:

- Anode: Electrode undergoing oxidation (more negative or less positive reduction potential).
- Cathode: Electrode undergoing reduction (more positive reduction potential).

- How do you calculate cell potential (E°_{cell})?

Answer Explanation:

Use the standard reduction potentials from the table:

- Identify the two half-reactions.
- Determine which is oxidation and which is reduction.
- Calculate the standard cell potential:

$$E^{\circ}_{\text{cell}} = E^{\circ}(\text{reduction at cathode}) - E^{\circ}(\text{reduction at anode})$$

Additional Notes:

- A positive E°_{cell} indicates a spontaneous reaction.
- For non-standard conditions, use the Nernst equation to adjust calculations.

- What is the purpose of a salt bridge in an electrochemical cell?

Answer Explanation:

The salt bridge completes the electrical circuit and allows ions to flow, maintaining charge neutrality. It prevents the buildup of excess charge that would halt electron flow. Typically, it contains an inert electrolyte like KCl or NaNO₃.

Review Tip:

- Without a salt bridge, the cell would quickly stop functioning due to charge imbalance.
- How does concentration affect cell potential?

Answer Explanation:

According to the Nernst equation, changes in concentration alter the cell potential:

$$E = E^\circ - \left(\frac{RT}{nF}\right) \ln Q$$

Where:

- Q is the reaction quotient (ratio of product to reactant concentrations).
- Increasing reactant concentration or decreasing product concentration increases E, making the cell more spontaneous.

Study Tip:

- Be comfortable applying the Nernst equation to real-world problems.

Question What are the main components of an electrochemical cell? The main components include two electrodes (anode and cathode), an electrolyte solution, and a salt bridge or porous barrier that allows ion transfer to maintain charge neutrality. How do you determine which electrode is the anode and which is the cathode in a galvanic cell? The anode is the electrode where oxidation occurs and is negatively charged in a galvanic cell, while the cathode is where reduction occurs and is positively charged. The anode is typically the metal that loses electrons, and the cathode gains electrons. What is the significance of standard reduction potentials in electrochemical cells? Standard reduction potentials provide a measure of the tendency of a species to gain electrons under standard conditions. They are used to predict the direction of electron flow

and calculate cell potentials for electrochemical reactions. How do you calculate the cell potential (E° cell) for a given electrochemical cell? The cell potential is calculated by subtracting the standard reduction potential of the anode from that of the cathode: $E^\circ \text{ cell} = E^\circ \text{ cathode} - E^\circ \text{ anode}$. Alternatively, $E^\circ \text{ cell} = E^\circ \text{ reduction (cathode)} + E^\circ \text{ oxidation (anode)}$. What are some practical applications of electrochemical cells? Electrochemical cells are used in batteries and fuel cells for portable power, electrolysis for metal extraction and electroplating, and sensors such as pH meters and glucose monitors.
