1. What is Satellite Communication?

Answer:

Satellite communication is the technology of transmitting and receiving signals via artificial satellites orbiting the Earth. It involves using satellite transponders to relay signals between ground stations, enabling services such as television broadcasting, internet access, GPS navigation, and military communications. The system typically includes ground stations (earth stations), satellites (space segment), and communication links.

2. What are the different types of satellite orbits?

Answer:

Satellites are categorized based on their orbital parameters:

- Geostationary Orbit (GEO):

4. What is a transponder in satellite communication?

Answer:

A transponder is an essential component onboard a satellite that receives signals from the ground station, amplifies them, shifts their frequency, and retransmits them back to the Earth. It acts as a relay station, enabling communication over vast distances. Key functions include:

- Frequency translation
- Signal amplification
- Filtering and switching

5. Describe the uplink and downlink in satellite communication.

Answer:

- Uplink: The communication link from the ground station (Earth station) to the satellite. It involves transmitting signals at a specific frequency to the satellite's transponder.
- Downlink: The transmission from the satellite back to the ground station, carrying the relayed signal.

Both links operate at different frequency bands to prevent interference, such as C-band, Ku-band, or Ka-band.
