Natural History of Cyclura

Taxonomy and Distribution

The genus *Cyclura* is comprised of approximately 15 species, including well-known types such as the Ricord's iguana (*Cyclura ricordii*), the Mona ground iguana (*Cyclura cornuta*), and the rock iguanas of the Bahamas. These iguanas are primarily endemic to the Caribbean islands, with each species adapted to unique island habitats. Their distribution ranges from Cuba and the Dominican Republic to the Bahamas, Puerto Rico, and the Cayman Islands.

Habitat and Ecology

Cyclura species occupy a variety of habitats, including dry rocky outcrops, coastal scrublands, and forested areas. They are primarily terrestrial, spending most of their time on the ground, but some species also utilize elevated sites for basking or nesting. These iguanas are herbivorous, feeding mainly on leaves, fruits, flowers, and sometimes cactus pads, which contribute to seed dispersal in their ecosystems.

Behavior and Social Structure

Most *Cyclura* species are diurnal, basking in the sun during the day to regulate their body temperature. They exhibit territorial behavior, with males often defending territories through displays and combat during breeding seasons. Juveniles tend to be more secretive, hiding from predators and competing for resources.

Reproductive Biology

Cyclura iguanas are known for their relatively long lifespans, often exceeding 20 years in captivity. They are oviparous, laying clutches of eggs that are buried in sandy or loose soil. Incubation periods vary by species but generally range from 60 to 90 days. Hatchlings are vulnerable and require suitable conditions for growth and survival.

Husbandry of Cyclura

Enclosure Design and Environment

Creating a habitat that mimics their natural environment is essential for the health and well-being of Cyclura in captivity.
