Understanding LED-Based Visible Light Communications (VLC)

What is Visible Light Communication?

Visible Light Communication (VLC) is a wireless communication technology that transmits data using visible light emitted by LEDs. Unlike traditional RF signals, VLC employs the visible spectrum (approximately 400-700 nanometers), making use of existing lighting infrastructures for data transmission. VLC systems modulate the intensity of LED lights at high speeds, imperceptible to the human eye, carrying information to receivers equipped with photodetectors.

How Does LED-Based VLC Work?

The core principle involves modulating LED lighting sources at high frequencies to encode data. When the LED light flickers at a rapid rate, it creates a pattern that can be decoded by a photodiode or a camera sensor. This process involves:
