Flow Path of Coolant in the Ford Mondeo

- Coolant Circulation from the Water Pump

The water pump draws coolant from the radiator via the lower radiator hose and pushes it into the engine block through the thermostat housing.

- Engine Heating and Thermostat Regulation

As the coolant absorbs heat from the engine, its temperature rises. The thermostat remains closed until the coolant reaches the optimal temperature (typically around 90°C or 194°F), at which point it opens.

- Heat Dissipation via the Radiator

Once the thermostat opens, hot coolant flows through the radiator's core. The radiator's fins facilitate heat exchange, dissipating heat into the atmosphere.

- Cooling Fans Activation

When coolant temperature exceeds a preset limit, electric or mechanical fans activate to enhance airflow through the radiator, further cooling the coolant.

- Return to the Engine

Cooled coolant exits the radiator and returns to the engine via the upper radiator hose, completing the cycle.

- Expansion Tank Management

As the coolant heats, it expands and excess coolant flows into the expansion tank. When cooled, the coolant is drawn back into the system, maintaining pressure and preventing air pockets.
