Cell Recognition and the Immune System

The Basis of Cell Recognition

At the heart of immune responses lies the ability of cells to recognize each other. This process hinges on the presence of specific molecules on cell surfaces:

- **Cell Surface Antigens:** These are glycoproteins and glycolipids that serve as identifiers, allowing immune cells to distinguish between self and non-self.
- **Major Histocompatibility Complex (MHC):** Essential for presenting antigen fragments to immune cells, MHC molecules play a critical role in immune activation and tolerance.

The Immune System's Mechanisms

The immune system employs a multi-layered defense strategy:

- Innate Immunity: The first line of defense, involving physical barriers (skin, mucous membranes) and innate immune cells like macrophages that respond quickly to pathogens.
- Adaptive Immunity: A specific response involving lymphocytes (B and T cells). Key processes include:
 - Antigen recognition: B cells produce antibodies targeting specific antigens.
 - Clonal selection: Expansion of lymphocytes tailored to the invading pathogen.
 - Memory cells: Provide long-term immunity, enabling faster responses upon re-exposure.

Immune Response and Vaccination

Vaccines mimic pathogen exposure, stimulating the production of memory cells without causing disease. Modern vaccine technologies, such as mRNA vaccines, exemplify advances covered in this unit.

Genetic Information, Mutations, and Gene Expression

DNA Structure and Replication

A fundamental topic, DNA's double helix structure enables precise replication:

- Semi-conservative replication: Each new DNA molecule contains one original strand and one newly synthesized strand.
