Step-by-Step Breakdown of the Answers for Case 3

The following sections break down the typical solutions and best practices for implementing the required functionality.

1. Creating the Product Class

- Define attributes such as `product_id`, `name`, `price`, and `quantity`.
- Implement getter and setter methods for data encapsulation.
- Include a method to display product details in a formatted manner.

```python

class Product:

def __init__(self, product_id, name, price, quantity):

self.product_id = product_id
```

self.name = name

self.price = price

self.quantity = quantity

def display_product(self):

print(f"ID: {self.product_id} | Name: {self.name} | Price: ${self.price:.2f} | Quantity: {self.quantity}")

```

## 2. Implementing Data Validation

- When accepting user inputs, validate data types and value ranges.
- For example, ensure that `price` and `quantity` are positive numbers.

```python

def get_positive_float(prompt):

while True:

try:

value = float(input(prompt))

if value > 0:

return value

else:

print("Please enter a positive number.")

except ValueError:

print("Invalid input. Please enter a numeric value.")

```
```

3. Building the Menu-Driven Interface

- Offer options to add, display, or exit.
- Use loops to keep the program running until the user chooses to exit.

```python

def main():

products = []

while True:

print("\nInventory Management System")

print("1. Add Product")

print("2. Display Products")

print("3. Exit")

choice = input("Select an option (1-3): ")

if choice == '1':

add_product(products)

elif choice == '2':

display_products(products)

elif choice == '3':

print("Exiting the program.")

break

else:

print("Invalid choice. Please try again.")
```

```

## 4. Adding Products to the Inventory

- Collect validated input data.
- Instantiate a new `Product` object and append it to the list.

```python

def add_product(products):

product_id = input("Enter Product ID: ")

name = input("Enter Product Name: ")

price = get_positive_float("Enter Price: $")

quantity = get_positive_float("Enter Quantity: ")

new_product = Product(product_id, name, price, quantity)

products.append(new_product)

print("Product added successfully.")

```

5. Displaying All Products

- Loop through the list and call display methods.

```python

def display_products(products):

if not products:

print("No products in inventory.")

```
else:

print("\nCurrent Inventory:")

for product in products:

product.display_product()
```

Detailed Examination of the Answers

Let's explore the typical answers to Case 3 in depth, focusing on key aspects such as class design, input handling, calculations, and output formatting.

Class Design and Implementation

Most solutions revolve around a well-structured class, for example, a `Product` or `Employee` class, with the following characteristics:

- Data Members:

Encapsulate core data such as IDs, names, prices, hours worked, or salaries.

- Constructors:

Initialize objects with default or user-specified values, ensuring valid initial state.

- Member Functions:
- Setters and getters for data access
- Functions to perform calculations like total pay, tax, or discounts

Best Practices Observed:

- Use of `const` correctness in accessor functions
- Validation within setters to prevent invalid data (e.g., negative prices)
- Clear naming conventions for readability

User Input Handling

Effective input handling is critical:

- Use of loops to re-prompt on invalid entries
- Validation checks to ensure data integrity
- Clear prompts for user guidance

Example:

```cpp

void getProductData(Product& p) {

cout
cin >> p.id;

cout
cin >> ws; // whitespace handling

getline(cin, p.name);

do {

cout
cin >> p.price;

if (cin.fail() || p.price
cout
cin.clear();

cin.ignore(numeric_limits::max(), '\n');

} else {

break;

}

} while (true);
```

}

```

Calculation Logic

Answers often include functions to compute values such as:

- Total cost, including taxes or discounts
- Average values
- Percentages and ratios

Implementation Tips:

- Encapsulate calculations within class member functions for modularity
