Overview of Hematology

Hematology is a multidisciplinary field combining aspects of pathology, immunology, biochemistry, and physiology. It involves understanding the normal physiology of blood components, the mechanisms of blood formation, and the pathogenesis of blood-related diseases.

Components of Blood

Blood is a specialized connective tissue composed of cellular elements suspended in plasma. The main components include:

Red Blood Cells (Erythrocytes)

- Responsible for oxygen transportation
- Contain hemoglobin, a protein that binds oxygen
- Lifespan: approximately 120 days
- Production: occurs in the bone marrow

White Blood Cells (Leukocytes)

- Key players in immune response
- Types include neutrophils, lymphocytes, monocytes, eosinophils, and basophils
- Their functions range from defending against infections to mediating allergic responses

Platelets (Thrombocytes)

- Involved in blood clotting and wound healing
- Derived from megakaryocytes in the bone marrow
- Lifespan: about 7-10 days

Plasma

- The liquid component of blood
- Contains water, electrolytes, hormones, nutrients, waste products, and plasma proteins such as albumin, globulins, and fibrinogen

Hematopoiesis: Blood Cell Production

Hematopoiesis is the process of blood cell formation, primarily occurring in the bone marrow in adults. It involves the differentiation of multipotent stem cells into various blood cell lineages.

Stages of Hematopoiesis

- Hematopoietic stem cells (HSCs) differentiate into progenitor cells
- Progenitors commit to specific lineages: erythroid, myeloid, or lymphoid
- Further maturation leads to functional blood cells

Regulation of Hematopoiesis

- Controlled by cytokines and growth factors, such as erythropoietin, thrombopoietin, and granulocyte-colony stimulating factor (G-CSF)
- Disruptions can lead to blood disorders like anemia or leukemia

Laboratory Techniques in Hematology

Accurate diagnosis of hematological conditions depends on various laboratory tests, including:

Foundations of Hematology: Anatomy and Physiology of Blood

The foundation of hematology rests on a thorough understanding of blood's composition, functions, and production.

Composition of Blood

Blood is a specialized connective tissue composed of:

- Plasma (55%): The liquid matrix containing water, electrolytes, proteins, hormones, and waste products.
- Formed Elements (45%):
 - Red blood cells (erythrocytes): Responsible for oxygen transport.
 - White blood cells (leukocytes): Key players in immune defense.
 - Platelets (thrombocytes): Critical for blood clotting.

Physiological Functions

Blood performs vital functions, including:

- Oxygen and carbon dioxide transport.
- Nutrient delivery and waste removal.
- Immune defense mechanisms.
- Hemostasis and clot formation.

Hematopoiesis: Blood Cell Formation

Hematopoiesis is the process by which all blood cells are generated, primarily occurring in the bone marrow in adults.

- Hematopoietic Stem Cells (HSCs): Multipotent cells capable of self-renewal and differentiation.
- Lineage Commitment:
 - Myeloid lineage: Gives rise to erythrocytes, granulocytes, monocytes, megakaryocytes (platelet precursors).
 - Lymphoid lineage: Produces lymphocytes (B cells, T cells, natural killer cells).

This process is tightly regulated by growth factors and cytokines, such as erythropoietin (EPO), thrombopoietin (TPO), granulocyte colony-stimulating factor (G-CSF), and interleukins.
