Catalytic Cracking Kfupm

catalytic cracking kfupm is a vital process in the petroleum refining industry, playing a crucial role in converting heavy hydrocarbon fractions into more valuable lighter products such as gasoline, diesel, and other essential petrochemicals. The King Fahd University of Petroleum and Minerals (KFUPM), located in Dhahran, Saudi Arabia, is renowned for its advanced research and educational programs in chemical engineering and related fields, including the study and development of catalytic cracking technologies. This article provides an in-depth exploration of catalytic cracking, its significance at KFUPM, and how it shapes the future of petroleum refining.

Understanding Catalytic Cracking

What Is Catalytic Cracking?

Catalytic cracking is a chemical process used in petroleum refineries to break down large, complex hydrocarbon molecules found in heavy crude oils and residual fuels into simpler, more commercially valuable products. This process employs a catalyst—usually a solid acid material such as zeolites—to facilitate the breaking of carbon-carbon bonds at elevated temperatures.

Importance of Catalytic Cracking in Oil Refining
